

**AMENDMENTS TO THE CLAIMS**

Please **AMEND** claims 47-49, 67-69, and 87-93 as shown below.

This listing of claims will replace all prior versions, and listings, of claims in the application.

1-46. (Canceled)

47. (Currently Amended) A content processing apparatus comprising:

a first storage section that stores therein an apparatus identifier unique to the content processing apparatus and ~~identification~~ specific data;

an encrypting section that encrypts content and the ~~identification~~ specific data using the apparatus identifier; and

an output section that stores the encrypted content and the encrypted ~~identification~~ specific data in content storage medium ~~in association with each other~~ which is detachable from the content processing apparatus.

48. (Currently Amended) The content processing apparatus according to claim 47, further comprising:

an authentication section that determines whether access is allowed to a first area of the content storage medium, the content storage medium having the first area and a second area,

wherein the output section stores the ~~identification~~ specific data encrypted in the first area, and stores the content encrypted in the second area.

49. (Currently Amended) The content processing apparatus according to claim 47, further comprising:

a second storage section that stores therein a title of the content, in association with the ~~identification~~ specific data.

50-66. (Canceled)

67. (Currently Amended) A content processing apparatus comprising:

an input section that reads out encrypted content from a content storage medium which is detachable from the content processing apparatus, and encrypted first ~~identification~~ specific data from the content storage medium;

a first storage section that stores therein second ~~identification~~ specific data and an apparatus identifier unique to the content processing apparatus;

a decoding section that decodes the encrypted first ~~identification~~ specific data using the apparatus identifier; and

a comparing section that compares the decoded first ~~identification~~ specific data with the second ~~identification~~ specific data stored in the first storage section,

wherein when the decoded first ~~identification~~ specific data agrees with the second ~~identification~~ specific data, the decoding section decodes the encrypted content using the apparatus identifier.

68. (Currently Amended) The content processing apparatus according to claim 67, further comprising:

an authentication section that determines whether access is allowed to a first area of the content storage medium, wherein which the encrypted first ~~identification~~ specific data is stored in the first area and the encrypted content is stored in a second area of the content storage medium.

69. (Currently Amended) The content processing apparatus according to claim 67, further comprising:

a second storage section that stores therein a title of the content corresponding to the second ~~identification~~ specific data; and

a display section that displays the title stored in the second storage section when the comparison of the comparing section indicates that the first ~~identification~~ specific data agrees with the second ~~identification~~ specific data stored in the first storage section.

70-86. (Canceled)

87. (Currently Amended) A content processing apparatus that, in an information management system where digitized information of content is managed as a file on a detachable content storage medium and use of the digital information is allowed only in an environment

providing a specific identifier, writes the digital information into the content storage medium, the content processing apparatus comprising:

a first storage section that stores an apparatus identifier unique to the content processing apparatus, and ~~identification~~ specific data which is different from the apparatus identifier and which is for determining whether the encrypted content to be stored in the content storage medium can be decoded properly;

an encrypting section that encrypts the content using the apparatus identifier and encrypts the ~~identification~~ specific data using the apparatus identifier; and

an output section that stores the encrypted content and the encrypted ~~identification~~ specific data in the content storage medium ~~in association with each other~~.

88. (Currently Amended) The content processing apparatus according to claim 87, wherein:

the content storage medium comprises a first area for which authentication is required for access and a second area for which authentication is not required;

the content processing apparatus further comprises an authentication section that determines whether access is allowed to the first area of the content storage medium; and

the output section stores the encrypted ~~identification~~ specific data in the first area and stores the encrypted content in the second area in association with the ~~identification~~ specific data.

89. (Currently Amended) The content processing apparatus according to claim 87, wherein the content processing apparatus comprises a cellular telephone, and the apparatus identifier comprises a telephone number or a serial number of the cellular telephone.

90. (Currently Amended) A content processing apparatus that, in an information management system where digitized information of content is managed as a file on a detachable content storage medium and use of the digital information is allowed only in an environment providing a specific identifier, writes the digital information into the content storage medium, the content processing apparatus comprising:

an input section that reads out encrypted content and encrypted ~~identification~~ specific data stored in the content storage medium ~~in association with each other~~;

a first storage section that stores an apparatus identifier unique to the content processing apparatus, and ~~identification~~ specific data which is different from the apparatus identifier and which is for determining whether the encrypted content to be stored in the content storage medium can be decoded properly;

a second storage section that stores the content;

a decoding section that decodes the encrypted content and the encrypted ~~identification~~ specific data read out from the content storage medium using the apparatus identifier; and

a comparing section that compares decoded ~~identification~~ specific data obtained by decoding the encrypted ~~identification~~ specific data with the ~~identification~~ specific data stored in the first storage section,

wherein, when the decoded ~~identification~~ specific data agrees with the ~~identification~~ specific data stored in the first storage section, the decoding section decodes the encrypted content using the apparatus identifier.

91. (Currently Amended) The content processing apparatus according to claim 90, wherein:

the input section reads out the encrypted ~~identification~~ specific data before reading out the encrypted content from the content storage medium;

the comparing section compares ~~identification~~ specific data obtained by decoding the encrypted ~~identification~~ specific data at the decoding section with the ~~identification~~ specific data stored in the first storage section and determines whether the decoded ~~identification~~ specific data agrees with the stored ~~identification~~ specific data; and

only when the decoded ~~identification~~ specific data is determined to agree with the stored ~~identification~~ specific data, the input section reads out the encrypted content from the content storage medium, and the decoding section decodes the encrypted content using the apparatus identifier.

92. (Currently Amended) The content processing apparatus according to claim 90, wherein:

the content storage medium comprises a first area for which authentication is required for access and a second area for which authentication is not required;

the content processing apparatus further comprises an authentication section that determines whether access is allowed to the first area of the content storage medium; and the input section reads out the encrypted ~~identification~~ specific data from the first area and reads out the encrypted data from the second area.

93. (Currently Amended) The content processing apparatus according to claim 90, wherein the content processing apparatus comprises a cellular telephone, and the apparatus identifier comprises a telephone number or a serial number of the cellular telephone.
